Absolutely. Here is the complete backend — `server.js`, `package.json`, `.env.example`, and a local-memory fallback so the demo runs even if an API key misfires mid-presentation. Every line is commented for the agent.

---

1. Scaffold the backend

```bash
mkdir -p team-truth/backend && cd team-truth/backend
pnpm init
pnpm add express cors dotenv groq-sdk
```

---

2. `package.json` (verify it matches)

```json
{
"name": "teamtruth-backend",
"version": "1.0.0",
"type": "module",
"main": "server.js",
"scripts": {
"dev": "node --watch server.js",
"start": "node server.js"
},
"dependencies": {
"cors": "^2.8.5",
"dotenv": "^16.4.7",
"express": "^4.21.2",
"groq-sdk": "^0.11.0"
}
}
```

---

3. `.env.example`

```env
PORT=5000
GROQ_API_KEY=gsk_your_key_here
HINDSIGHT_API_KEY=hs_your_key_here
HINDSIGHT_API_BASE=https://api.vectorize.io/v1
HINDSIGHT_ORG_ID=your_org_id
HINDSIGHT_PIPELINE_ID=your_pipeline_id
```

```

---

## 4. `server.js` — the entire backend in one file

```javascript
// ============================================================
// TeamTruth — Zero-Trust Accountability Agent (Backend)
// Stack: Node.js · Express · Groq SDK · Vectorize Hindsight
// STRICT RULE: No Python. Everything is JavaScript/ESM.
// ============================================================

import express from "express";
import cors from "cors";
import dotenv from "dotenv";
import Groq from "groq-sdk";

dotenv.config();

const app = express();
app.use(cors());
app.use(express.json());

const PORT = process.env.PORT || 5000;

// ────────────────────────────────────────────────────────────
// 1. CLIENT SETUP
// ────────────────────────────────────────────────────────────

// Groq — ultra-fast LLM inference
const groq = new Groq({ apiKey: process.env.GROQ_API_KEY });

// Hindsight — Vectorize persistent memory REST config
const HS = {
base: process.env.HINDSIGHT_API_BASE || "https://api.vectorize.io/v1",
key: process.env.HINDSIGHT_API_KEY,
org: process.env.HINDSIGHT_ORG_ID,
pipeline: process.env.HINDSIGHT_PIPELINE_ID,
};

// ────────────────────────────────────────────────────────────
// 2. HINDSIGHT SERVICE (with local fallback)
//
// The local fallback keeps an in-memory array so the demo
// never crashes on stage if the API key is wrong or the
// network drops. The agent should always try the real API
// first, then silently fall back.
// ────────────────────────────────────────────────────────────
```
```

```
const localMemoryStore = []; // fallback

/**
* Store a memory in Vectorize Hindsight.
* Falls back to local array if the API is unreachable.
*/
async function storeMemory(content, metadata = {}) {
const entry = {
id: crypto.randomUUID(),

// Step 2 — Retrieve this user's entire memory trail
const memories = await queryMemory(user, { user });
console.log(`[Chat] ${user} → ${memories.length} memories found`);

// Step 3 — Calculate current trust score
const trustScore = calculateTrustScore(memories);

// Step 4 — Build the context block for Groq
const memoryBlock = memories.map((m) => `• ${m.content}`).join("\n");

// Step 5 — Send to Groq for real-time contradiction analysis
const completion = await groq.chat.completions.create({
model: "llama-3.3-70b-versatile",
temperature: 0.25,
max_tokens: 600,
messages: [
{
role: "system",
content: `You are **TeamTruth**, a Zero-Trust Accountability Agent embedded in a team workspace.

Your capabilities:
- You have persistent memory of every promise, claim, and deliverable made by each team member (provided below).
- You cross-reference new statements against historical records.
- You detect contradictions, broken promises, and patterns of unreliability.
- You calculate and report a Trust Score (0–100%).

HISTORICAL MEMORY FOR "${user.toUpperCase()}":
${memoryBlock || "(No prior records found — this user has a clean slate.)"}

CURRENT TRUST SCORE: ${trustScore}%
```

```
RESPONSE RULES:
1. If the new message contradicts the historical memory, lead with "⚠️ Contradiction detected." and cite the specific conflicting records.
2. Always state the Trust Score prominently.
3. If trust is below 50%, recommend task reassignment.
4. If no contradiction exists, acknowledge the claim positively and note the trust score.
5. Be concise, direct, and data-driven. No fluff. Use bullet points.
6. Never fabricate memory entries — only reference what is provided above.`,
},
{
role: "user",
content: `${user} just posted in the team chat:\n"${message}"\n\nAnalyze this against their track record.`,
},
],
});

const analysis =
completion.choices?.[0]?.message?.content || "⚠️ Analysis unavailable — LLM returned empty.";

// Step 6 — Persist the AI's analysis back into Hindsight
// (so future queries can reference prior verdicts)
await storeMemory(`TeamTruth verdict on ${user}: ${analysis}`, {
user,
type: "ai_analysis",
trust_score: trustScore,
});

// Step 7 — Respond to the frontend
res.json({
success: true,
user,
originalMessage: message,
analysis,
trustScore,
memoriesFound: memories.length,
timestamp: new Date().toISOString(),
});
} catch (err) {
console.error("[Chat] error:", err);
res.status(500).json({ success: false, error: err.message });
}
});

// ── GET /api/memories/:user ──────────────────────────────────────────
// Utility endpoint: lets the frontend's right-pane dashboard
// pull all stored memories for a given user.
app.get("/api/memories/:user", async (req, res) => {
const { user } = req.params;

try {
```

```
const memories = await queryMemory(user, { user });
const trustScore = calculateTrustScore(memories);

res.json({
success: true,
user,
trustScore,
count: memories.length,
memories,
});
} catch (err) {
console.error("[Memories] error:", err);
res.status(500).json({ success: false, error: err.message });
}
});

// ═══════════════════════════════════════════════════════════════════════════
// 5. START
// ═══════════════════════════════════════════════════════════════════════════

app.listen(PORT, () => {
console.log(`
╔═══════════════════════════════════════════════════╗
║ 🔍 TeamTruth Backend ║
║ → http://localhost:${PORT} ║
║ → POST /api/memory/seed (load demo) ║
║ → POST /api/chat (analyze) ║
║ → GET /api/memories/:user ║
║ → GET /api/health ║
╚═══════════════════════════════════════════════════╝
`);
});
```

---

5. How to run the demo in 60 seconds

```bash
# Terminal 1 — Start server
cd team-truth/backend
cp .env.example .env # paste real keys
pnpm dev

# Terminal 2 — Seed memory, then fire the "wow" moment
curl -X POST http://localhost:5000/api/memory/seed

curl -X POST http://localhost:5000/api/chat \
-H "Content-Type: application/json" \
-d '{"user":"Bob","message":"Hey team, I finished the database."}'
```

```

The response you get back is the exact demo moment:

```json
{
"success": true,
"user": "Bob",
"originalMessage": "Hey team, I finished the database.",
"analysis": "⚠️ Contradiction detected. Historical memory shows 3 prior claims about the database schema (March 16, 17, 18) — all with 0 linked commits...",
"trustScore": 34,
"memoriesFound": 3,
"timestamp": "2026-03-20T16:32:00.000Z"
}
```

Key design decisions worth noting

Why the local fallback exists. Hackathon Wi-Fi is unreliable and API keys get rate-limited at the worst possible moment. The `localMemoryStore` array catches everything silently so the live demo never shows a 500 error to a judge. The real Hindsight calls are always attempted first — the fallback only activates on failure.

Why `temperature: 0.25`. You want the contradiction analysis to be deterministic and reproducible. If a judge says "show me that again," you need the same output, not a creative reinterpretation.

Why the analysis gets stored back into Hindsight. This creates a compounding memory effect — the agent remembers its own prior verdicts. If Bob gets flagged twice and then claims "I already fixed it," the third query now has *both* the original broken promises *and* the prior AI analyses as evidence. That's the kind of emergent behavior that wins hackathons.

Why the `22`-point penalty. Three strikes at 22 each = 34% trust score. That's the exact number in your demo script. If you want it to land on exactly 33%, change it to `Math.round(100 / 3)` or hardcode the penalty to `22.33`.

frontend :

Here is the **complete frontend** — every file, every component, every animation. Copy each file into the exact path shown. Your agent gets a production-grade glassmorphism UI with React Bits–style components wired directly to the backend.

---

1. Scaffold & Install

```bash
cd team-truth
pnpm create vite frontend -- --template react
```
```

```
cd frontend
pnpm add framer-motion react-router-dom react-hot-toast lucide-react
pnpm add -D tailwindcss @tailwindcss/vite
```

---

2. Config Files

`vite.config.js`

```js
import { defineConfig } from "vite";
import react from "@vitejs/plugin-react";
import tailwindcss from "@tailwindcss/vite";

export default defineConfig({
plugins: [react(), tailwindcss()],
server: {
port: 3000,
proxy: {
"/api": "http://localhost:5000",
},
},
});
```

---

3. Global CSS — `src/index.css`

This single file holds every glassmorphism utility, glow animation, and the Prism design system.

```css
@import "tailwindcss";

/* ── PRISM DESIGN TOKENS ──────────────────────────────────────── */
@theme {
--color-prism-bg: #0a0a0f;
--color-prism-surface: rgba(255, 255, 255, 0.03);
--color-prism-border: rgba(255, 255, 255, 0.06);
--color-prism-text: #e2e8f0;
--color-prism-muted: #64748b;
--color-prism-accent: #818cf8;
--color-prism-danger: #f87171;
--color-prism-success: #34d399;
--color-prism-warning: #fbbf24;
--color-prism-glow-1: #6366f1;
--color-prism-glow-2: #8b5cf6;
--color-prism-glow-3: #06b6d4;
```

```
}

4. React Bits–Style UI Components

`src/components/ui/Aurora.jsx`

```jsx
// Animated gradient blobs — used as full-page background
export default function Aurora() {
return (
<div className="pointer-events-none fixed inset-0 -z-10 overflow-hidden">
{/* Dark radial base */}
<div className="absolute inset-0
bg-[radial-gradient(ellipse_at_center,_rgba(15,15,30,1)_0%,_rgba(10,10,15,1)_70%)]" />

{/* Blob 1 — Indigo */}
<div
className="aurora-blob absolute -left-1/4 -top-1/4 h-[600px] w-[600px] rounded-full"
style={{ background: "radial-gradient(circle, #6366f1 0%, transparent 70%)" }}
/>

{/* Blob 2 — Violet */}
<div
className="aurora-blob-delayed absolute -right-1/4 top-1/3 h-[500px] w-[500px] rounded-full"
style={{ background: "radial-gradient(circle, #8b5cf6 0%, transparent 70%)" }}
/>

{/* Blob 3 — Cyan */}
<div
className="aurora-blob-slow absolute -bottom-1/4 left-1/3 h-[550px] w-[550px] rounded-full"
style={{ background: "radial-gradient(circle, #06b6d4 0%, transparent 70%)" }}
/>

{/* Noise overlay for texture */}
<div
className="absolute inset-0 opacity-[0.015]"
style={{
backgroundImage: `url("data:image/svg+xml,%3Csvg viewBox='0 0 256 256'
xmlns='http://www.w3.org/2000/svg'%3E%3Cfilter id='n'%3E%3CfeTurbulence type='fractalNoise'
baseFrequency='0.9' numOctaves='4' stitchTiles='stitch'/%3E%3C/filter%3E%3Crect width='100%25'
height='100%25' filter='url(%23n)'/%3E%3C/svg%3E")`,
}}
/>
```

```
</div>
);
}
```

`src/components/ui/SpotlightCard.jsx`

```jsx
import { useRef, useState } from "react";

// Card that tracks cursor and renders a radial spotlight
export default function SpotlightCard({
children,
className = "",

---

6. App Shell — `src/App.jsx`

```jsx
import { BrowserRouter, Routes, Route } from "react-router-dom";
import Aurora from "./components/ui/Aurora";
import Navbar from "./components/Navbar";
import LandingPage from "./components/LandingPage";
import ChatInterface from "./components/ChatInterface";

export default function App() {
return (
<BrowserRouter>
<Aurora />
<Navbar />
<Routes>
<Route path="/" element={<LandingPage />} />
<Route path="/app" element={<ChatInterface />} />
</Routes>
</BrowserRouter>
);
}
```

---

7. Entry — `src/main.jsx`

```jsx
import { StrictMode } from "react";
import { createRoot } from "react-dom/client";
import App from "./App";
import "./index.css";

createRoot(document.getElementById("root")).render(
<StrictMode>
<App />
</StrictMode>
);
```

---

8. Run Everything

```bash
```

```
# Terminal 1 — Backend
cd team-truth/backend
pnpm dev

# Terminal 2 — Frontend
cd team-truth/frontend
pnpm dev
```

Open **`http://localhost:3000`**.

---

9. Demo Walkthrough (exactly what the judges see)

```
Step 1 → Landing page loads with aurora blobs, animated headline,
feature cards with cursor-tracking spotlights.

Step 2 → Click "Launch the Agent" → slides into the chat interface.

Step 3 → Click "Seed Memory" button in the chat header.
→ System message: "🧠 Memory seeded. 3 historical logs loaded for Bob."
→ Right-pane dashboard populates with 3 BROKEN PROMISE cards.
→ Trust gauge stays at awaiting state.

Step 4 → Click the quick-message pill: "Hey team, I finished the database."
→ User bubble appears on the right.
→ Typing indicator pulses.
→ Agent response slides in with a RED GLOW border:

"⚠️ Contradiction detected. Hindsight Memory shows you
claimed this on Tuesday, but 0 commits are linked.
Trust Score reduced to 33%.
Recommending task reassignment."

→ Trust gauge in the right pane animates from 100 → 34%.
→ Gauge ring turns RED. Label switches to "UNTRUSTED".
→ Infraction counter updates.

Step 5 → Try the other quick messages to show the agent's
compounding memory. Each new excuse gets cross-referenced
against every prior verdict. The trust score can only
recover if the user provides evidence.
```

Component Architecture Map

```
App.jsx
├── Aurora.jsx ..... animated gradient background (fixed)
├── Navbar.jsx ..... glass nav bar with route links
├── LandingPage.jsx
│   ├── SplitText.jsx ..... letter-by-letter hero animation
│   ├── GradientText.jsx .... gradient-colored text spans
│   ├── SpotlightCard.jsx ... cursor-tracking feature cards
│   └── StarBorderButton.jsx conic-gradient animated CTA
└── ChatInterface.jsx
    ├── SpotlightCard.jsx ... dashboard cards with spotlight
    ├── TrustGauge.jsx
    │   └── AnimatedCounter.jsx eased number counting
    └── (inline) ..... chat bubbles, typing indicator,
quick pills, memory log entries
```

Every component is self-contained, uses only Tailwind + framer-motion + CSS from `index.css`, requires zero additional dependencies, and connects to the backend through the Vite proxy at `/api`. No Python anywhere in the stack.

First create a venv before starting project so it doesn’t conflict with global pacakges
